SecureWave

Quick Start Guide | Public Beta

NO INTERNET PERMISSION | NO DEVELOPER DATA COLLECTION

SecureWave stores required protected information locally. External apps chosen for encrypted payload delivery have their own privacy practices. Beta software is not independently audited or suitable as the sole emergency communication method.

1 Install SecureWave

Open GitHub Releases: github.com/TerminalAirspeed/SecureWave/releases

Download the signed Public Beta APK under Assets and verify its SHA-256 against the release value.

Install on Android 10 or newer. Allow installation from the chosen file source only if prompted.

To update, install a compatible newer APK over the existing one. Do not uninstall merely to upgrade.

2 Add a trusted contact

Contacts > Add Contact. Prefer Hybrid Secure Pairing (P-256 + ML-KEM).

Exchange the pairing objects and compare the COMPLETE verification code on both devices before confirming. Cancel if any digits differ.

For manual contacts: generate a 32-character code; Copy Code is an intentional clipboard disclosure. Exchange the secret using a trusted channel.

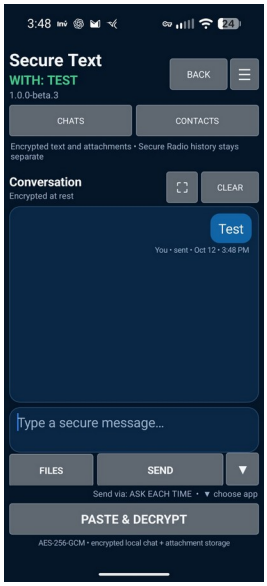

Use Search contacts and Favorites to navigate large contact lists. Manual shared-key group sender names are self-declared.

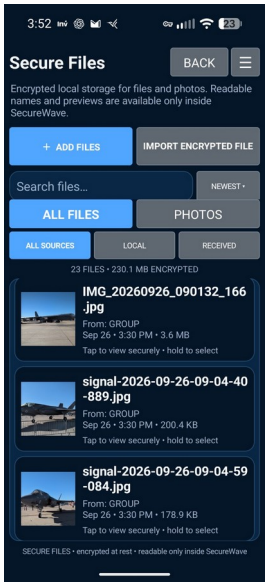

3 Send and receive an encrypted message

Secure Text > Chats > choose the intended recipient. Write the message and tap Send.

Choose an external app to hand off the encrypted payload. SecureWave itself has no Internet-delivery service.

Recipient: use Paste & Decrypt (or the encrypted import action) in SecureWave. Confirm delivery separately.

4 Secure Files

Add Files protects a file in the local encrypted vault. Import Encrypted File authenticates a received file.

Search/filter local or received items; a Saved Decrypted Copy is plaintext outside SecureWave protection.

5 Secure Radio / Open Radio

Secure Radio is encrypted digital radio messaging. Open Radio is explicitly unencrypted over the air.

Check supported radio/audio/PTT hardware and verify RX ON, input route and output connection before transmitting.

Manual PTT: hold the radio keyed for the complete burst. Radio is half-duplex; transmissions are not delivery-acknowledged.

6 Safety and privacy essentials

Use App Lock if desired. Protected screenshots are disabled by default, with a temporary authorization for normal screens.

Secure Clear destroys local contacts, keys, chat/history, files and settings; it cannot erase external copies.

U.S. law: do not transmit encrypted content on amateur bands (47 CFR 97.113(a)(4)) or GMRS (47 CFR 95.1733). Part 90 may permit only authorized emissions and encrypted operation. Check your license and equipment rules.

If something does not work

- Decrypt fails: verify the contact, payload integrity and compatible version.
- Radio RX/PTT fails: check ON/OFF, audio route, channel, cabling and manual PTT.
- Pairing codes mismatch: cancel; never approve a partial match.
- For more detail, see the full SecureWave User Manual distributed with this beta.
